

Evaluation of the impact of library discovery technologies on usage of academic content

Presenters: Angela Conyers, Evidence Base (BCU)
Valérie Spezi, LISU (Loughborough University)

Why this study?

- Commissioned by UKSG/Jisc in July 2013
 - Lots of interest in library discovery technologies
 - Questions about whether libraries, publishers and other stakeholders should be engaging with those technologies
 - Follows on from the UKSG research report on Link resolvers and the serials supply chain and the work of KBART
- Small-scale study
 - A UK perspective
- No previous usage data analyses – fill in the gap
 - 2 studies about to report shortly
- Work started in July 2013

Objectives of the research

- Evaluation of the impact of library discovery technologies on usage of academic resources
- Provide evidence to determine if there is a case for
 - ✓ Investment in library discovery technologies by libraries
 - ✓ Engagement with library discovery technologies by publishers and other stakeholders in the information supply chain
- Provide recommendations for stakeholders to best support the discovery of academic resources
- Identify additional research, data, discussion and initiatives that will support the findings of the study

Methodology

- Phase 1: survey of UK HE libraries
 - Objective: determine the current RDS landscape
- Phase 2: case studies of libraries and publishers
 - Objective: collect usage data + views and perceptions on the impact of library discovery technologies
- Phase 3: interviews with stakeholders
 - Objective: obtain a bigger picture on the perceived impact of library discovery technologies and an insight of where the sector is going

Methodology (cont'd)

- Survey: 62 respondents
 - ✓ Online questionnaire distributed to UK HE library directors
- 8 publishers and stakeholders
- 6 case study libraries
- Data received from 6 libraries & 4 publishers/content providers
 - ✓ COUNTER JR1, BR2 and DB1 or close equivalent

Phase 1: UK RDS landscape

RDS use in academic libraries

The UK HE landscape:

- **77%** of UK HE libraries are already using an RDS at their institution
- A further **11%** are in the process of implementing an RDS
- RDS implementation in HE libraries had probably reached its peak in the last 12 months

Phase 1: UK RDS landscape

RDS products used by UK HE libraries

- 3 products dominate the library discovery market in our sample
- Half of the survey respondents considered the RDS to be a replacement for their previous OPAC, although there was an indication that online catalogues are still needed for some specific transactions

Phase 2: usage study

What are we going to present?

1. General findings – general picture

- Data received from the 6 participating libraries and 4 of the participating publishers
 - Libraries' usage data – journal, e-book and database
 - Publishers' usage data – journal

2. Findings for a case study library – more detailed picture

Overall journal usage trends

Slide 9

VS2

there may be a new graph - see Claire

Valérie, 05/11/2013

Overall journal usage trends – constant titles

Overall e-book usage trends

Overall e-book usage trends – constant titles

Overall database usage trends

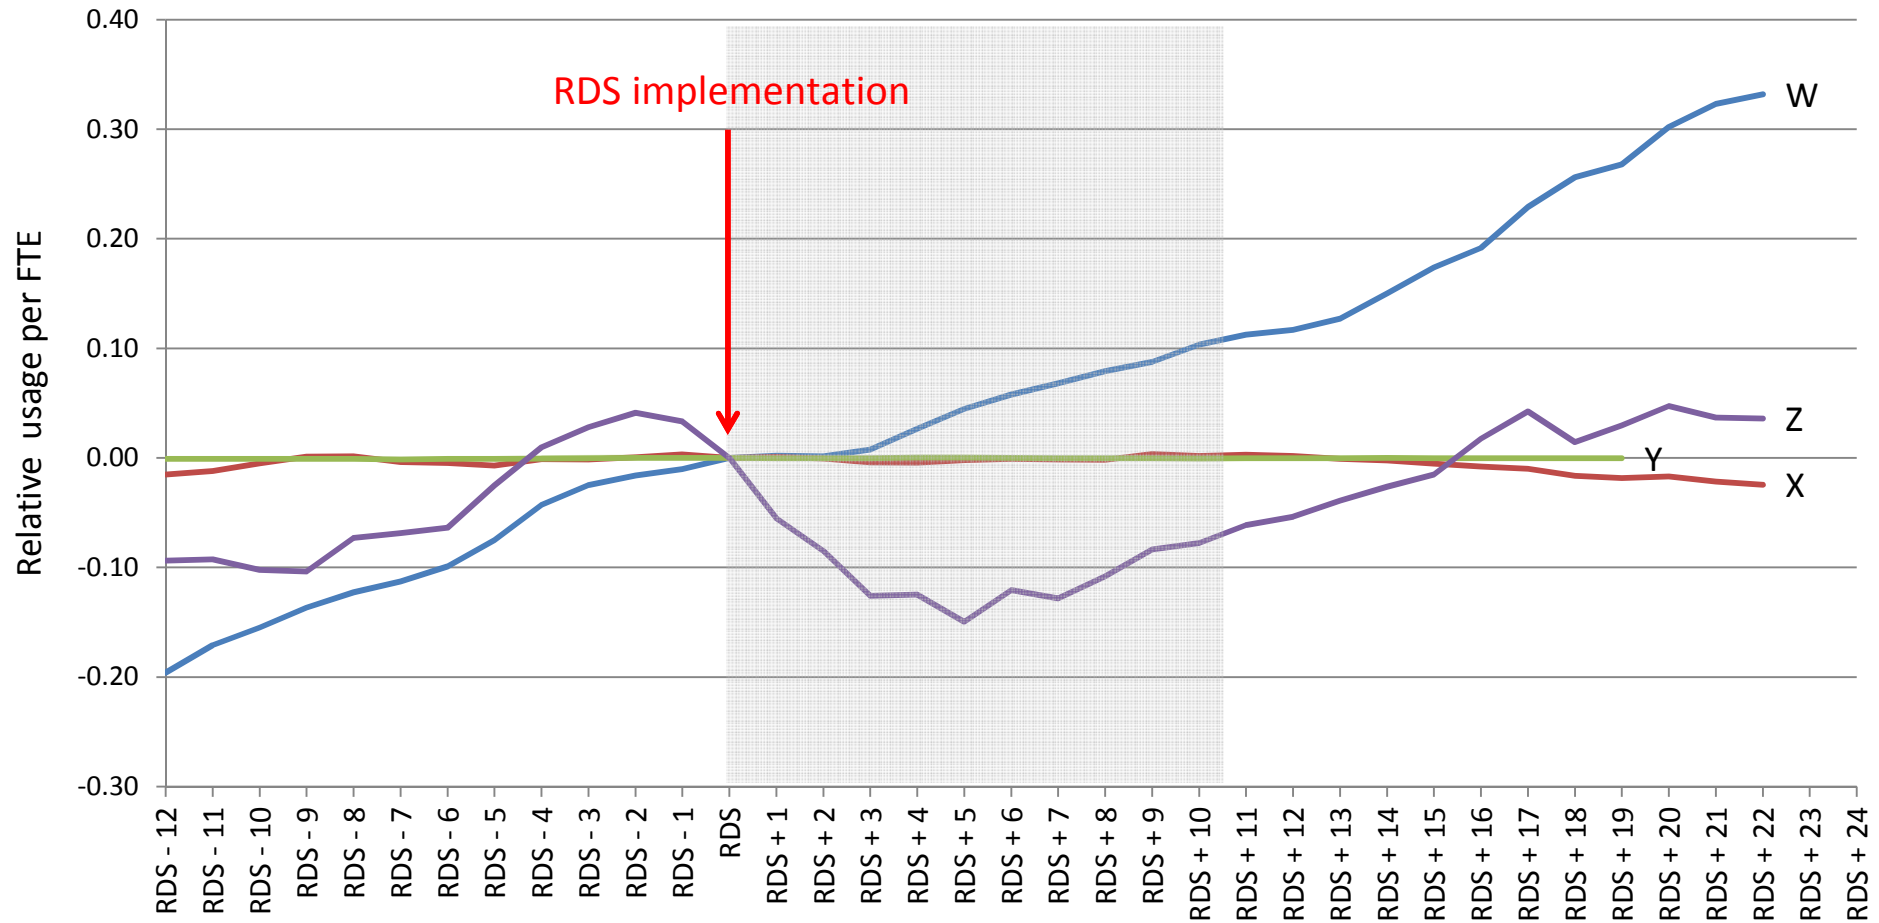

Slide 13

VS3

check graph again with claire - ok for one library omitted but what about the other one missing?

Valérie, 05/11/2013

Publishers - overall journal trends

Broad picture – key findings

- What does the usage analysis suggest?
 - Journals – some impact
 - E-books – definitely a positive impact
 - Databases – cannot tell
- Interpretation of the aggregated data – challenge - why?
 - Multi-dimensional environment – lots of noise in the results
 - other factors may affect usage, notably the volume of content available
 - We've tried to control for this with the 'constant titles' but there may be other factors
 - No common pattern by type of resources for each library
 - Except for e-books maybe?
- Next: look at a case study library in greater detail

Overall time series for journals, eBooks and databases – data for a single case study library

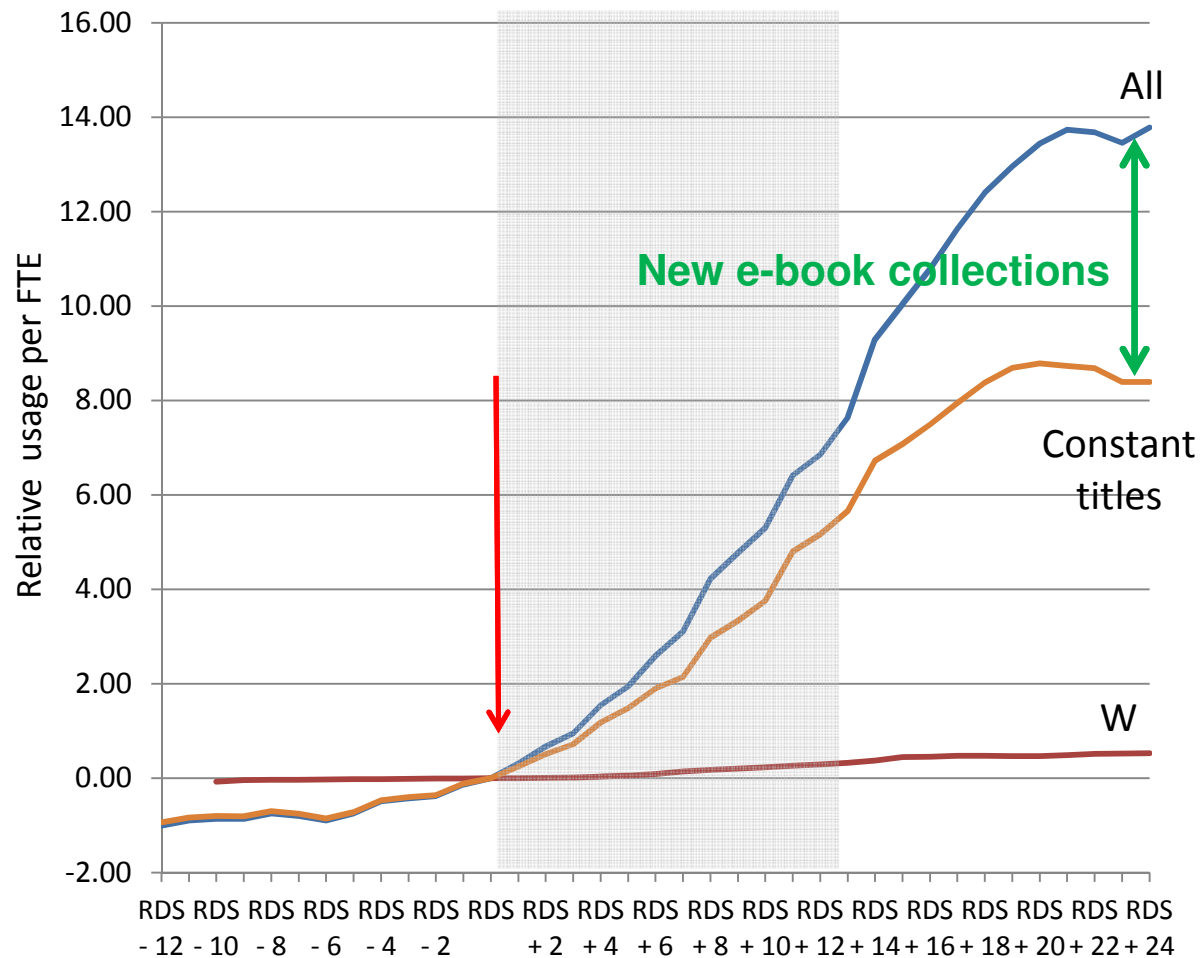

Logarithmic scale

Journal usage per FTE for library E

- Journal usage levels increasing before RDS
- RDS effect on constant titles shows a decrease in usage level immediately after implementation and then a sustained increase at a higher pace

E-book usage per FTE for library E

- Overall usage going up
- Constant titles going up
Increase inflated by one
- Subscription making up for 70% of the usage of the constant title set throughout
- E-book usage for publisher W increased by a factor of 8

Database usage per FTE for library E

- database usage increased significantly immediately after RDS
- Issues with database counting?

Usage analysis - summary

What can we say from the usage analysis?

- No straightforward answer – but it seems that overall library discovery technologies influence positively the use of academic resources
 - The effect may vary according to the type of resources – e-books seem to benefit greatly from RDS
- Isolating the sole impact of RDS is a challenge – multi-dimensional environment
 - Many other factors may affect usage – we have tried to control for content growth by providing an analysis including constant titles
- More data needed for a meaningful analysis
 - 2-year post-implementation data is not enough to pick up a trend and isolate other variables influencing usage

Additional findings from libraries

Perceived advantages for libraries:

- Generally, high levels of library satisfaction with RDS
- Increased usage – borne out by usage data
- Enhanced user experience (primary motivation – not increased usage)
 - One stop shop = single interface linked to full text
- Better use of subscriptions – no silos

Perceived challenges:

- Usage data analysis – not done routinely
- RDS searching aimed at undergrads? Starting point?
 - Can researchers benefit from RDS too?
- Lack of clarity in coverage from RDS suppliers
- Interoperability between systems
- Lack of co-operation between some publishers and some RDS suppliers

Additional findings from publishers and content providers

Perceptions when engaging with RDS:

- Improving discoverability and visibility of content
 - still very low traffic from RDS compared to search engines
 - particularly relevant for smaller publishers?
 - better service for their authors and readers
 - can publishers afford to wait and see where it is going?

Perceived challenges:

- Metadata RDS optimisation for improved discoverability
- Dilution of the publisher's brand within the RDS
- Lack of feedback/communication from RDS suppliers
- Lack of visibility and understanding of how data are used
 - Relevancy ranking

Other stakeholders in the information supply chain – some key findings

RDS – great tool – probably changing the library landscape in the short to medium term

But the use of RDS raises some questions:

- ✓ Are RDS a long term valid solution to Web-scale information searching?
- ✓ Costs & benefits to libraries?
- ✓ What is the effect on A&I databases for specialist information?

THANK YOU!

- Recommendations soon available in the full report that will be presented to UKSG
